Email Validation, Mar 30th, 2006

Reviewed By: phileas777

To all noobs like me: this script has a weakness: the email validation. The script checks ONLY if the address is well built (e.g. email023@mydomain.com is valid) AND if it comes from your website. The "sender" can use your domain name to create spams (still valid as the recommendation comes from your site and use a correct address). Use with caution. Script needs to be improved.
