HTML_ToPDF (PDF on the Fly)

Hits: 41,630

Description: Printing webpages is great, but every browser renders a page differently. This can cause problems if you need to be able to print a page that looks the same no matter what platform or browser is being used. Additionally, PDF files can be searched and browsed as a sort of notebook, making it a useful file format for large text files. This script takes the hassle out of generating a PDF file from your webpage. Use it to convert online receipts, documents, etc. into a format that will look the same on any platform and printer. Includes support for converting images, using the stylesheets to customize the look of the PDF file, PDF encryption and permissions, and error handling.

Resource Specifications	
Version:	3.5
Platform(s):	linux, windows, freebsd, osx
Price:	PHP License
Date Added:	Dec 17th, 2001
Last Updated:	Nov 19th, 2006
Author:	Jason Rust
