Hits: 5,057

Description: Booklistex allows you create an organized list of your favorite books. You can keep one just for your pleasure, or share it with your family, students, friends, or colleagues. It incorporates Amazon.com's book database and its simple interface allows you to add and delete books easily. To add a book, all you need to do is to find the book at amazon.com, copy the url and paste it into the script. Booklistex will then extract the necessary information automatically. The script is very flexible, you can use a template to customize the appearance. The book list supports multi-page viewing. You can even set how many rows and columns each page shows.

The unfortunate thing about this script is that it displays ONLY the book cover - linked to Amazon. It doesn't print out the book title or the author name underneath. So if you want a script that fetches book covers from Amazon, you're in luck. Anything else and you're wasting your time with this script.
