Appgini PHP Generator For MySQL

Hits: 97,242

Description: Instantly create multi-user PHP web database interfaces that let users view, sort, search and edit data of a MySQL database easily from a single web page. You can create user groups with different access permissions to data. Display database contents to your site visitors as web or email links, as images, file links, check-boxes or simply as plain text. You can do all this easily without any SQL or PHP knowledge. You can fully customize the look of the generated files using CSS and easy HTML templates. Create foreign key (lookup) fields that allow users to select values for a field from another table (for example to select customer name in a receipt). Users can download data as CSV files to open in Excel. Let users upload files and images to the database, and view them as images or download links. When you modify the database design in AppGini, the actual database will be automatically updated by simply re-uploading the files. Download your free non-expiring trial now.

AppGini combines easy operation with outstanding support, Feb 14th, 20

Reviewed By: commsec

I am a novice at database design and forms using php and MySQL. I found this little windows program and gave it a shot. I have to say it was very easy to understand and took very little time to get a relatively complex relational database up and running. It offers great flexibility in the data types as well as outstanding support from the author. I had a few non standered needs and contacted the author with some questions. He responded quickly, with clear and helpful answers to my questions. The program runs fine on XP and builds all the forms as well as automating the database installation procedure. You just upload the entire generated directory to your server and when you attempt to query any form it presents you with an automated database installation routine, when the procedure completes you are presented with a menu of your database forms and you are ready to go. The program, although very simple to understand, offers a multitude of options such as foreign fields, hidden fields, ect. The generated forms are easy to customize to match your tastes and the capabilities of this program is only limited by your talent. I highly recommend this program to anyone who needs to get a database online quickly without having to design and code every form and query. With great customer support to match you can't go wrong.

Brilliant time saving tool, Feb 17th, 2003

Reviewed By: niron

Using this program I was able to design my 26 tables inventory and supplier chain management database, define relationships between tables, and generate various versions of my db front-end. Each version with its own permissions that allow employees to view and/or modify the records according to their authorities.

The scripts ran smoothly after setting up the db (using one of the scripts) and every employee was able to access the data from anywhere via the net and search easily using the cool filters provided.

What's really unique about this program (something I didn't find in any similar program) is the ability to easily create relationships between tables, something like the lookup wizard of MS Access, and it's even easier to use. For example, I can define suppliers in a single table and then have all spare parts, raw materials and other items tables see the suppliers as a drop down menu that is automatically updated when I update them in the suppliers table.

With the help of the author (who provided surprisingly rapid support), I was able to insert images in the tables and create some helpful reports. I wish the reports were easy to create inside the prog instead of writing the sql code myself.

The only problem that I found was with the date fields, which you have to view and edit using the weird format "year-month-day", but it wasn't a big issue though.

The trial version of this program allowed me to create only 4 tables, but for \$35, I guess its a very good investment that saved me a fortune hiring a programmer to do it.

Too many disabled features, Mar 21st, 2002

Reviewed By: artlader

I think this might be very good software, but so many features were crippled that I simply uninstalled it. Grrrrrrr....

Excellent, Feb 6th, 2003

This is an excellent script that works well on windows machines.

A Must Have Tool, Aug 19th, 2003

Reviewed By: kwilson

After reviewing scripts for over 6 weeks, this is, by far, the best out there. No errors on install or programs to date. Well worth the \$35!

The Best \$59 I have spent in a long time!, Jan 19th, 2005

Reviewed By: pbsjr@optonline.net

This program is great. I am just learning PHP and not nearly ready to write the code that this program generated with less than 10 minutes of my time. I would recommend it to anyone. The code is clean, well organized and functional without an program tweaking. I just admired and learned from the code.

AppGini and it's Developer " Rock" , Mar 21st, 2008

Reviewed By: rcmwatchdog

I had never ventured into PHP and MySQL. Using Appgini and MySQL 2 AppGini created the entire site. I even had some speacial table mods I needed. The Developer helped me usually the same day. I can not say enough about the pro version of this app. Now it has user authentication (my version did not implement this yet). Makes this App even more of a deal. I am reloading this version and recompiling my site. On my test server to test it. I am sure I won't be left down. Keep up the good work. RCMdog!
