Apache HTTP Server Project

Hits: 6,662

Description: The Apache HTTP Server Project is a web server that can support many different operating environments (operating systems) and hardware platforms such as x86, PowerPC, sparc, and almost any you could think of. If they don't support it, they will. Apache is the daddy of all servers out there today, and best of all, it is what keeps most internet websites free to users and allows for cheap web hosting. If you wish, download Apache for use on your Windows box to test your PHP applications before you upload them to your site.
