Web Secretary

Hits: 2,512

Description: Web Secretary is a web page monitoring software. However, it goes beyond the normal functionalities offered by such software. Not only does it detect changes based on content analysis (instead of date/time stamp or simple textual comparison), it will email the changed page to you with the new contents highlighted. Web Secretary is written in Perl and should be able to run on all Unix systems with the Perl interpreter (and LWP module) installed.

Resource Specifications
