## Book Viewer

Hits: 2,341

**Description:** Create an old-fashioned library old style books from any text file. Many choices of book style are available. Automatically generate an index, with chapters and pages... the book even has a page-turning sound. Create any type of book by take a photograph of the cover and inside pages and splitting the image up into chunks for the script to process.

This is fun, and a great way to add some style to documents you need to place on the web.

Upload a text file to the Internet and let users view it as a real book, even turn pages with sound effects. If you have multiple books, they are displayed in a library from which to choose the book you want.

The words are set up to fit the page perfectly, and the pages are created automatically. The script divides the book up into pages on the fly, and you may scroll through the contents by clicking on the sides of the page. There are a variety of books styles available, and by scanning in YOUR covers and pages it is simple to create your own templates.

This script will create a table of contents automatically for books which have chapters.

What could it be used for? Maybe you want to post an online journal, short stories you've written, or even a whole novel!
