## Rollingpin: weblog reading lists in ASP

Hits: 992

**Description:** It's an easy way to add a blogroll (list of weblogs you read) anywhere on your site, via blo.gs or BlogRolling. It uses XSL and CSS to format the output, so you can customise it easily. Oh, and it caches the output to save on bandwidth, only updating once an hour at most (it only checks when someone visits a page with the code on).
