Synchronization between XML Schema and database. Hits: 1,237

Description: SysDB is a tool for synchronizing XML Files (based on XML Schema) and a Relational Database. XML files are stored and managed in a database.

- Data are managed in configuration : when you change a XML file, only this file will be added into the base. Old versions can be easily retrieved from the database.
- Database Schema is automatically deducted from the XML Schema.
- Database and XML Schema are synchronized automatically keeping the base management as simple as possible : there is no need to create a new base each time the Schema changes.
