VisualTextbox - Online HTML Editor

Hits: 19,354

Description: VisualTextbox is an online HTML editor. It allows final user to format text, add links, tables, etc... thanks to a floating control panel, and everything from his web browser, without having to know about HTML code.

The editor has been developed to be used as easily as any HTML form element, and more precisely as a replacement of the TEXTAREA form element.

Technologies used are PHP 4, DHTML and JScript. On server side, the VisualTextbox control can be easily integrated in a PHP page, and on the browser side it requires Microsoft Internet Explorer 6.

Several VisualTextbox controls can be used in the same page, sharing the floating control panel, but with their data staying independant.

The user interface is at the moment available in english, french, spanish (thanks to Hugo Gomez), german (thanks to Ulrich Wolf) and polish (thanks to Wojtek Slowakiewicz) and can easily be translated in another language.

VisualTextbox is distributed under the LGPL licence. It means you can redistribute and/or modify it freely and use it in any free or proprietary software.

Never even took the time to download and try because of the product's demo page. The scrip checks for browser, and if its not MICROSOFT IE, It will not let you load. >:(I hate being forced to use IE.. Could be a good product if the creators were more open minded. ;) Not an insult, just a word of advice.
