MailForm.py

Hits: 2,486

Description: MailForm.py is a Python port of the C version of the popular MailForm script. It supports a large number of customizable form fields which allow you to determine the script's behavior. It was written and tested on Python 2.1. It should work with a standard Python installation on most operating systems. MailForm.py supports multiple recipients, custom mail headers, cookies, and many other features. It is source code, and may be customized for individual needs, such as adding FastCGI support.
