Common Controls

Hits: 1,374

Description: The Common-Controls form a Java Presentation Framework based on Java Servlets, Java Serverpages (JSP) and Struts. The Presentation Framework contains the most common control elements like lists, trees, tabfolders, menus and forms, which are required for the development of J2EE applications with HTML frontends.

The control elements distinguish themselves by the fact that they automatically save their own state across server roundtrips, so that the scrolling mechanism of a list, for example, or the explosion and folding of a tree structure do not have to be implemented independently. Rather, the state is managed by the control element itself, so that the developer can concentrate on the actual and important aspects of a Web application, such as the technical sequences or providing the data. The Framework takes over the presentation.

Resource Specifications	
Version:	1.5
Platform(s):	linux, windows, osx, sun
Price:	75
Date Added:	May 8th, 2004
Last Updated:	Apr 16th, 2005
Author:	Gernot Schulz

Average Visitor Rating:  **4.50** (out of 5)
Number of Ratings: 6 Votes
