Server to server backup

Hits: 1,488

Description: Automatically backup any server to a remote location. Software runs as root so SQL databases and system files can also be backed up. Schedule multiple backups to run from several servers. When local backup is complete, remote server logs in to fetch zipped archive. There are two scripts, one for the server being backed up and one for the remote server. They can work together or independently.

Resource Specifications

Version:	0.3
Platform(s):	linux, freebsd
