### **EUpload Joy and Dispair!**, Feb 2nd, 2001

Reviewed By: wwwnet

This CGI script (version 1) has great features, being the only script I could find where you can specify destination directories via the browser interface.

It has 2 defects.

Firstly, just filling-in the necessary variables did allow the script to function, but uploaded files were zero bytes i.e. empty! But the filename was complete.

I isolated this to the line "use strict;" which is "dead code" according to the latest issue of CGI.pm.

As a consequence I changed the next line to read:

```
"use CGI gw(:standard);"
```

The script now works fine, but the file size limitation refuses to function...have not had time to fix this!

If anyone has the time i would like to hear comments....

Cheers!
