rc_formValidator.class

Hits: 1,714

Description: With rc_formValidator.class you can validate userinput submitted via webforms. It has several different types of checks. Error messages can be set userdefined or be retrieved from an internal error reporting system, which also has info about the fieldname and its value. All error messages are returned in an array for further processing. The class is easy to use - sample files show how to use each type of check available. Also, a full documentation is available.

Resource Specifications

Version:	0.2.1
Platform(s):	linux, windows
