Full Convert 1.0 Standard MySQL Edition Hits: 1,135

Description: Full Convert provides you with comfortable way to convert data between many different databases. For highest possible speed and reliability, Full Convert uses native access to databases wherever possible. Currently, native connections are used for Interbase/Firebird, MySQL, Oracle and SQL Server databases.

Full Convert 1.0 supports following databases (future version will support even wider variety of data formats)

- Microsoft Access
- dBase
- Microsoft Excel documents
- Interbase / Firebird
- Lotus 1-2-3
- MySQL
- Oracle
- Paradox
- SQL Server
- Delimited text files

All editions feature target database browser with multiselect which greatly simplifies certain actions.

Standard Edition

Standard Edition supports (besides conversion itself) dropping of all tables or selected tables/columns.

Professional Edition

Professional Edition adds a powerful action and parameters handling. Similar tools require that you make mappings from source tables and columns to target, often with cumbersome interface to handle the amount of data displayed. Full Convert makes a swift conversion and puts you in control of target database with additional functionality which enables you to transform database and data structure with ease. Extract several columns to a new table leaving a referencing column, merging data from a table into another, renaming tables and columns and changing their properties, drop unused columns or tables, conditional data changing using your own parameters... Not to mention you can see how many

records each table has so you know where your data is.

Full Convert remembers all actions and stores them in saved session file. Next time you want to convert, all you have to do is press a button and all your actions are executed after conversion over new data and with no additional work from your side

Resource Specifications

Version:	1.0
Platform(s):	windows
Date Added:	Sep 10th, 2004
Last Updated:	Sep 10th, 2004
