CiberTienda

Hits: 5,669

Description: CiberTienda is an Open Source virtual shopping system. It is a cgi system which connects to a DataBase with all the information of the shop. At this moment PostgreSQL is only database supported, but it is planning to support DB2, mySQL, Oracle, Informix and Sysbase. It is very easy to create a shop. You have to install the binaries, install the templates, modify them with your shop name, logo, sections, look & feel, etc..., add an entry for the shop in your web-server, and add the products directly into the database or using the administration web interface.

Resource Specifications
