## Resolver

Hits: 2,511

**Description:** Resolver is the easiest way to do forward and reverse hostname/IP lookups from an application. Resolver is a simple COM object (built in Visual C++) that can do forward and reverse lookups on internet IP addresses and hostnames. The object includes 4 methods for resolving IP addresses to hostnames and resolving hostnames to IP addresses. The setup package includes a help file for technical reference on the component and information on dotted IP formats. The package also includes VB and ASP sample code that demonstrates how to use the component.
