PiwiP

Hits: 1,876

Description: You can run PiwiP (the PHP Scripts) on a php-server while the pictures are on another picture-server. It is essential that the picture-server allows directory-listing!

PiwiP does not use a database (like mysql). All comments/explanations (except this file and the GNU License) are in German.

A short introduction:

1. Be sure your picture-server has activated directory listing.
2. Be sure no index.html (or index.htm) is in the (sub)directory of the gallery-path on the picture-server.
3. You can use png, jpg, gif or bmp files.
4. Adjust the url of the picture-server (\$initialurl) in piwip.conf.
5. Adjust the path of the include-directory (\$includepath) in piwip.conf.
6. Adjust the path of piwip.conf in index.php and gallery.php.

Once installed it is for administrators very easy to expand the gallery, just create a directory with pictures on the picture-server (or add/change/delete some picture in an existing directory). The name of the directory will be shown in the html-output.
