## Replete Mail Broadcaster

Hits: 1,882

**Description:** This is a very easy, self-contained email broadcaster with Inline Substitution using any number of User Defined Fields, which means, you can tailor the message for each person you send it to. You put the Message in one file and the Email list with User Defined Fields in another file, and just press "Send". The message file can be Plain Text or HTML. The format of the file is automatically detected.

The Address File contains the User Define Fields separated by a comma. You can have any number of User Define Fields, however, the first field must be the Email Address receiving the message. And the first row of the Address File contains the name of the User Define Fields.

### Resource Specifications
