Tab Menu

Hits: 3,475

Description: This is a simple class for creating tab menus for site navigation using HTML and CSS.

The class takes an array that defines the name of all the tab labels and the respective URLs and render the tabs in an HTML table using normal links. The currently active tab just displays its label text.

The tab menu may be aligned to the left, right or center of the page or container element. If left or right alignment is specified, the class may also display a label text before or after the menu table.

Resource Specifications

Platform(s):	linux, windows, freebsd, sun
