eSearch

Hits: 2,179

Description: eSearch uses the Open Directory Project Data as a data set and for formatting search results. The program queries the OPD third party provider for category listings and/or search results and then funnels the results back the browser with the appropriate formatting options. This provides the website user with a fully up to date data set for all searches and does not require to the website publisher to store any large data sets on the server.

Resource Specifications

Version:	3.0
