Nirus's phpBatch Creator

Hits: 1,013

Description: I developed this script so that at anytime I could easily create a batch file that would start, stop and restart Windows services remotely through a telnet like connection; particularly Apache and my mail server.

Other than operating Windows services I wanted some other common commands to be on hand. Included are many TCP/IP functions, shutdown, restart and log off Windows. All of these commands will work remotely as long as you have the required permissions on the machine the batch file lies. Enjoy!
