## PassMaster and Alldata Secure email forms

Hits: 2,042

**Description:** Send, Receive, & Manage Blind E-mail Accounts. This application was developed for non-profit businesses to allow their readers to send e-mail from the business Website, while keeping the actual e-mail address hidden from the sender. Likewise, the staff person can reply to an e-mail and not divulge their e-mail address. The receiver's e-mail address is hidden to protect their confidentiality. After all, they do not want to get on chain lists or receive attached photos, viruses, and the like. This technique has the additional value of preventing spammers or weirdos from finding any e-mail addresses.

PassMaster and Jonathon Press' AlsData. A combination of 2 scripts that we heavily modified to combine the two. Alldata (an email form contact script) was missing a way to password protect the administration part of the script. PassMaster did not have AlsData as part of the menu for the admin there. We modified it so you have a unique script that takes care of both problems.

### Resource Specifications

<b>Version:</b>	2.0
<b>Platform(s):</b>	linux, windows, freebsd, osx, sun
<b>Date Added:</b>	Jan 21st, 2005
<b>Last Updated:</b>	Jul 14th, 2008
<b>Author:</b>	MyWebTeks Host
