SplitImage

Hits: 1,082

Description: If you have image directories shared by several different pages and would like to organize them so that a unique image directory is used for each page, this script may provide a solution. It takes a shared image directory and makes a new page-unique directory for each page, creates copies of the original pages, each with references to its new image directory in place of the old, common directory, and copies the appropriate images from the common directory into the new, page-unique directories.
