## safedata

Hits: 1,471

**Description:** Safedata is a PHP class that effectively disables both register\_globals and magic\_quotes.

It includes wrapper functions for MySQL / MySQLi's escape string functions and for htmlentities / htmlspecialchars that allow you to use both strings and arrays.

It can also help with HTML forms, so you can ensure that the submitted form values are of the correct type (int, float, string, array).

Requires PHP 4 >= 4.1.0, or PHP 5.

### Resource Specifications
