GDFont Renderer

Hits: 2,775

Description: Nevermore be shackled by the appearance of jagged fonts. Release the bonds of using the same tired web typefaces over and over again. Save yourself immeasurable hours of creating individual text images for titles. The time has come to bathe in the omnipotence of dynamically generated text images. By harnessing the power of PHP and the commonly built-in GD library, you too can become a god among men.

This super-lightweight script allows you to render any text into any TrueType font that is then displayed as an image on your webpage. It includes the option to cache any image created to reduce server load.

Resource Specifications

Version:	1.7
