# Blogging Equalizer

Hits: 571

**Description:** Blog and Ping is a newly discovered technique of quickly getting your website indexed by major search engines. This software will automate the Blog and Ping process on all pages of your target website(s). Increase your search engine rankings by automatically capturing Google indexed pages, and then Blog and Ping them for other search engines to index. Use this tool to get your Web pages indexed for free, and then flood your website with free search engine traffic.

**Good idea, weak implementation**, May 11th, 2005

Reviewed By: PhoenixRising

I have used Blogging Equalizer to promote several pages. The first couple times it worked quite well, then I started having problems.

First, the program sporadically refused to log into my Blogger.com account. Then it spider my site to obtain the pages to blog, but when it logged into Blogger.com it would say it could not find the page.

I would then end up with a list that had some pages blogged and others not. There is no way to clear the status so the failed pages can then be blogged again.

It in now not converting an internal variable, `$$metadescription$$`, that it extracts from the page and puts on the blog. It is now just using the variable name instead of value.

The idea is good, the interface acceptable, the implementation very poor. I am currently trying to blog a site and have had to kill the program several times.

When I emailed support they acknowledged others were seeing the same problem and their programmers were working on it. This has been over a week, and I have not heard from them since. No patch has been forthcoming, and the program seems to be getting worse.

My recommendation is to wait for the next version which will hopefully correct the current shortcomings.
