**Description:** This script provides a way for your site visitors to recommend your site to a friend. They fill in their email address and a friends email address and when they click on recommend, it generates an email message to their friend advising them about the site. Additionally, the site admin gets a copy of the generated message along with the IP address of the person who filled in the form - as a safeguard against abuse. This is a single script that requires you to set an admin email, the domain that the script is used for and optionally modify the message that gets sent out when a site visitor recommends your site.
