Redbrix - user-oriented MySQL front end Hits: 1,378

Description: Redbrix is a browser-based, user-oriented data entry and querying interface for MySQL databases implemented in PHP.

It has been designed with maximum flexibility in mind: not only does Redbrix work with virtually any database imaginable, it also runs in a vast number of browsers, including Internet Explorer, Netscape, Firefox, Mozilla, Opera, Safari, Konqueror and even text-only browsers like Lynx and Links.

Such functionality comes at a small price: GBP 79.00 for an unlimited deployment licence, plus 12 months of inclusive online support and free upgrades.

The Redbrix site contains both downloadable and online demos so you can try it out for yourself before you buy.

Resource Specifications

Version:	2.5.1
Platform(s):	linux, windows, freebsd, osx, sun
