# PHP Generator For MySQL databases

Hits: 1,523

**Description:** phpBackend is an online tool that accelerates databases forms and script development. It converts your database structure definition into a PHP application and helps you to define a database.

It features enhanced HTML (colored text) fields, large file (>100mb) management, foreign keys and integrity constraints and sorting administration. You don't have to write PHP script.

It can work with your SQL definition (existing database) from scratch, creating a new database with the interface. You can create your database online and try phpBackend on the vendor's server before buying anything.

It includes a version for PostgreSQL. Many ways to navigate data are available (one to many in one page, long listing of titles, etc.).

Future developments includes a skin template.

## Resource Specifications

<b>Version:</b>	1.0
<b>Platform(s):</b>	linux, windows, freebsd, osx, sun
<b>Date Added:</b>	May 26th, 2005
<b>Last Updated:</b>	May 27th, 2005
<b>Author:</b>	Nadine St-Amand
