MeshCMS

Hits: 4,966

Description: MeshCMS is an online editing system written in Java. It provides a set of features usually included in a CMS, but it uses a more traditional approach: pages are stored in regular HTML files and all additional features are file-based.

It has been thought as a quick tool to edit pages online, without many of the features that most CMSes offer. MeshCMS simply helps you to edit pages, manage files and create some common components like menus, breadcrumbs, mail forms, image galleries and so on. There is no database, no content approval and no versioning. Not all people need those features and those giant-sized products that require too much time to be learned and too much system resources to run. MeshCMS is essential and requires few resources: the default 64MB heap is enough to host a handful of sites.

Main features are: file-based, easy to install, cross-browser, wysiwyg editor integrated, file manager, themes, modules, tag library, page caching, hotlinking prevention.

Resource Specifications

Version:	2.0.1
Platform(s):	linux, windows, freebsd, osx, sun
Date Added:	Jun 4th, 2005
Last Updated:	Jun 5th, 2005
Author:	Luciano Vernaschi
