An incredibly comprehensive calendar. Elegant customizable client-side validation. Date range restrictions. I counted 64 attributes properties available.

Lots of working examples. Depending on what part of the example you use, you may have to remove the javascript within the aspx file to avoid javascript errors. Since I don't use VS.net, I added the methods from SpecialDays.cs to the main cs file and removed autogenerated #region code. I also removed `AutoEventWireup="false"`.
