## PHP Point Of Sale for osCommerce

Hits: 6,971

**Description:** PHP Point Of Sale (POS) is a web based point of sale system designed to help small businesses with keeping track of customers, items, and sales. This program works great for businesses that use cash, check, or account numbers for their sales. This version is tailored for use with osCommerce. The pos will use the products from osCommerce for its sales and reports. This allows a user to just add products from within osCommerce and have them automatically available within PHP Point Of Sale. Inventory is also updated when a sale takes place.

This version fixes minor bugs.

### Resource Specifications
