CXS - Compact XML Serialization

Hits: 1,112

Description: CXS is an XML application for data serialization which offers the possibility of transferring complex data structures between programming languages.

CXS is aimed to offer a representation of data structures which is compact (few bytes) and effectively to parse in different programming environments.

CXS supports the serialization of the following data types:

- * scalar types: string, integer, double (aka. float), boolean
- * compound types: array (numerical), hash (associative array), object
- * special types: null
- * resource types: RecordSet, binarystream

The basic idea for CXS was to build up a serialization language for Flash (client) - PHP (server) communication which can be handled easily by both languages and keeps traffic as low as possible.
