Secureloads

Hits: 12,899

Description: Secureloads is innovative PHP application installed on your website to provide web based share and protection of a file folder of your web server.

The main idea behind this application is to allow your clients or partners get the files they paid for while securing the file area from those not supposed to get hold of your digital products. Secureloads works by defining and controlling access permissions on subfolders within your protected file area. It is ideally suited to control online access to folders with software updates, manuals, e-books, reports, datasheets or any other downloadable digital products. If you need feedback as new files from certain clients, you can allow upload access to a group of users to certain subfolders.

hitSecureFiles allows you to add a client-only downloads area to your website. Let your users register at your site, organize them into groups and control the customizable role-based group access to hierarchical security zones - from viewers to uploaders. The application fully integrates into virtually any PHP page on your site with only 2 file includes, inheriting your site look and feel. As the site admin you can
