# phpSecurePages

Hits: 108,946

**Description:** phpSecurePages is a PHP module to secures pages with a login name and password. It can handle multiple user groups (each with their own viewing rights), store data in a MySQL database or a configuration file, and be used to identify your Web site viewers. It also has multiple language support and session support for both PHP3 and PHP4.

Very good! Great Interface and a variety of options! Must have if you can't have .htaccess on your site and you want a nice clean easy program to use.

**This is perfect and works great!!**, Mar 2nd, 2002

This is definitely the best user authentication script you will find on the net. It can manage usergroups and is completely customisable. All you do is add one small line of code to your page and if the person tries to access the page the login page is shown instead. As soon as they login they are then taken to the page they wanted to go to.

I had a bit of trouble setting it up but I made sure I followed the excellent readme file and bingo it was working. This script can handle sessions which basically means that if your logged in then you can access any page without the login page coming up. The readme also tells you how to allow different user groups to view a page. Useful if your doing an admin page.

When you first set it up it is best if you have the database that is set as default.

I think that this script really is a must for anyone who is really serious about protecting their pages!!

**Excellent!**, Mar 24th, 2001
