Finding Items in an Array with PHP

Hits: 3,319

Description: This elementary tutorial describes how to search an array to see if a specific item lies in it. In the tutorial, we create an array of strings such as "Apple" and "Orange" then show you how to use PHP to find out that "Apple" is in the array but "Monkey" is not. This can be useful in PHP programs if you have a collection of items (perhaps that a user has entered) and you want to know if a certain item is in that collection.
