Dynamic FTP System

Hits: 2,322

Description: UPDATE: v1.3.15 Now Available (Visit site to see updated features)

The Dynamic FTP System is a user-friendly web based large file transfer program, which is designed for individuals and businesses that transfer large files regularly from and to multiple users (i.e. Architect to Subcontractors and vice versa). E-mail clients and FTP clients alike have file size restrictions that are now overcome with the Dynamic FTP System.

The administrator can easily create new users in seconds with only four clicks. Users are automatically notified of their account setup, username and password via e-mail.

The built in e-mail notification system informs the users when new files are ready for download and e-mails the administrator when users download a file.

* Will work with a SSL certificate to provide encrypted secure file transfers.

Many more features... Please see dynaftp.com for complete details.

Great Time Saver, Jan 14th, 2006

Reviewed By: mrcullers

Excellent time saver. I no longer need to call my business partners when I upload a file for them. The big savings for me is I no longer need to check to see if they got my file! WOW! The email notification is worth every penny. I expect to save labor hours because my staff does not depend on email anymore. And I can keep the files on the server as a backup, or I can download them from home too! Awesome guys! Thanks Alot!
