Form1 Builder MYSQL

Hits: 2,074

Description: With Form1 Builder MYSQL you can automatically have form submission data added to your MYSQL database with protection against form hijacking, email injection and email harvesting. To use the MYSQL option you must have a server based MYSQL database and it must have an existing table with field names that correspond to form field names. On form submission a new record is added to the MYSQL database table and MYSQL database table fields that have the same name as form fields will include the input values from the form field. Additional form variables can be added to the MYSQL table by including a field in the MYSQL table that has the same name as the field to be included. You can also include a range of User and Cookie Variables for automatic import into the MYSQL database. Form1 (the generated form code) runs on your web server. To run Form1 your server must support the php scripting language. Most commercial web servers support php.

Resource Specifications
