# PHP TreeView Ajax

Hits: 16,697

**Description:** Include the PHP TreeView classes and you can make your own REAL-TIME tree menus. Build a whole site WITHOUT PAGE RELOADS. Retrieve selected node(s) as php objects. The script is very dynamic with interchangeable design. It behaves like an ordinary JavaScript TreeView with real-time update but it's developed with PHP/Ajax (xajax). Features: Use your own image on every node.

Link to internal/external urls.

Each node can have it's own http string data.

Cross browser compability.

Optional checkboxes.

Optional radiobuttons.

Easy to add and remove nodes.

Use your own Style Sheet.

Hide root node.

Add endless number of nodes.

Really useful when showing Site Maps.

**Easy class independent of design, so good!**, May 10th, 2006

This is an excellent script that I've found after searching for a long time. The class is easy to use, the script is stable, and best of all, it's easy to integrate to any design... I really recommend this script!
