# Bugdar

Hits: 5,697

**Description:** Bugdar is a bug tracking system that is meant to replace other solutions that are slow and cumbersome. It features a completely comprehensive permissions and usergroups system that allows for extremely flexible control over what users can access. To ensure that your server never lags, portions of Bugdar's data is cached to both reduce load and increase speed. If you want to change any aspect of Bugdar's appearance, all you have to do is edit the semantic XHTML templates or one of the CSS definitions that control the entirety of Bugdar.

One of the unique features in Bugdar is the "automations" system. This allows administrators to define a macro that will change any field in a bug and then add a comment with the click of a button. This makes marking a bug closed, fixed, and leaving a comment when a bug is done very easy.

Other features include: custom fields, email notifications, Atom syndication, historical logging, "favorite" bugs, voting, and internationalization support.

## Resource Specifications

### **Problem with instalation, Oct 21st, 2006**

Reviewed By: bobolino

The idea of this script is great. unfortunately, i've received an error when i've tried to install the product. I've lose my time with this not tested program

### **Finally a Bugtracker that JUST WORKS, Oct 9th, 2007**

Reviewed By: Edorian

I've been searching for over a Week. From Mantis over Trac to commercial Solutions and the all hat various problems. Bloated, slow, buggy, missing features like Version and so on.

Then i found Bugdar. I got it installed in less then 2 Minutes WITHOUT even reading the Docs. Everything is where u expect it and it just works.
