## Simple Calendar Widget

Hits: 15,417

**Description:** A flexible, simple pop-up calendar written to work across browsers. It's fully commented and customisable for language, colours, date format and the week's start day. The pop-up displays a month at a time from a specified range of years. The optional year, month and day input determines the initial month displayed. Allows disabling of dates, date ranges and days of the week. Optionally draggable. This is ideal for combination with server-side technologies to produce a professional application.

Thanks a lot for this excellent script!! Clean code and well documented, making it very easy to use and customize. The cross browser compatibility is great! It looks the same in all major browsers/platforms. Very reliable!

Superb piece of work on the authors part. Had it up and running within a short time of downloading, and it has some pretty flexible configuration options.

The only enhancement I would ask for relates to positioning of the popup calendar on the target web page. Presently needs guru status as a JavaScript programmer to figure it out, maybe some parameters could be added at the top of the script? Other than that, brilliant work!
