An Introduction to Classes

Hits: 2,818

Description: This tutorial teaches you how to write and use classes, to make your PHP code more flexible and easier to manage. The tutorial guides you through the construction of a simple, security-related class that performs some basic security functions for a web site: checking user logons. The class implements security features that answer some needs for a number of current security models and could be easily implemented at most dynamic Web sites. Note that this class does not provide a full security solution.
