# QLR Manager

Hits: 12,573

**Description:** QLR Manager is a server based reporting, graphing and e-mail distribution tool for MySQL, Oracle and PostgreSQL. The application is 100% HTTP server based and is accessible using any newer mainstream browser... No client code to install. QLR Manager can be used as a stand-alone product or as middleware to integrate Report Objects into a website using an extensive set of PHP Class functions. Features include the ability to author and save individual or batches of queries, format reports by creating and saving layouts (Standard, Table, Pivoted and Custom), graph data with 5 chart styles, distribute output as e-mail, or download as HTML, XML, PDF and CSV files. You can also define macros to run queries with their associated layouts, organize queries and macros into menus, control access to limit user authorities, create HTML form controls to collect user input, and distribute customized e-mails based on addresses in your database. With the Wizard, knowledge of SQL isn't even required.

I was amazed at the power that QLR Manager has to offer. It gives me exactly the function I was looking for - the ability to create reports from my website's MySQL database and e-mail them where they need to go.

I run an OSCommerce for a client, I know little about MYSQL or PHP.

MY client has demanded more and more in depth reports, this programme enable me to write any report they want. I have also been able to build an area where they can run any of the report themselves. Support has been brill, can't fault it. If in doubt take the free trail, I bet you end up buying it :-)
