XUpload Pro - upload progress bar

Hits: 2,562

Description: XUpload is an advanced progress bar indicator for web based file uploads written on Perl. XUpload lets you to accept file uploads on your website and shows upload progress bar which is showing upload progress in realtime. Upload progress bar could be shown in popup window or right on the upload page. It also shows upload progress in percents, upload speed (kb/s), elapsed and remaining time, size of uploading files (useful when uploading multiple files). You can stop file upload process by just pressing stop button. If file transfer will fail during upload process - error message will be shown. XUpload will work on any hosting, virtual/shared or dedicated and on all platforms driven by Apache Web Server, Linux or Windows. There will be no problem with integration of XUpload with your login system because XUpload will "pass" all parameters through itself. In other words - it's absolutely "transparent" to any environment and could be integrated with any framework.

We're using this script for our file uploads. It's the best one in comparison with others on the market. Have a lot of features. Also, support is great - very helpful.

Xupload Pro is great tool, May 10th, 2007

I looked all over trying to find a simple cgi script. I found that filechucker was by far the best. If you have issues with your hosting service's PHP.INI max upload size then this is the way to go. Looking forward to future enhancements. Oh, and their forum support is really quick, they've installed the script on my server in 30 mins with no fee.
