PHPShield 3 PHP Encoder

Hits: 1,984

Description: phpSHIELD 3 PHP Encoder protects your PHP Source Code with a powerful, easy to use encoder, which creates a native bytecode version of the script and then encrypts it.

Some other PHP encoding systems do not use bytecode and it is very easy to reverse engineer their protected scripts back to the original source code. With bytecode encryption, it is never possible to do this as the original sourcecode has been completely removed from the protected file.

phpSHIELD v3.0 Great application!, May 4th, 2006

Reviewed By: EPPEPZ

i bought it last month: it was a great surprise!

It has fully native byte code encoding and it works on 99% of hostings without any php.ini modification and you don't need to install anything on server!

For example, last work i did it's on low costs server (only 8\$ a year)!

there aren't functions like ip or domain restricts or expires, but it's easy to do them with classical programming and then you can encode all!

security it's highest possible with sourcecode completely removed!
