Handy Address Book CGI

Hits: 931

Description: Handy Address Book CGI provides an address book you may view, modify, or administer using a web browser from any platform. You can define users and set permissions, so address books can be shared among multiple users with varying levels of access. Fully customizable, including colors, fonts, field labels, column ordering, and more so that you can integrate the address book into your existing web site. Ideal for sharing contacts among multiple users in an office, making a corporate directory available on your web site, networking your address book for access on multiple computers, or making your addresses available no matter where you travel. It can run anywhere with Perl CGI support and requires no non-standard Perl modules.

Resource Specifications

Version:	1.3
