Mailing List WWW Gateway (LWGate)

Hits: 2,118

Description: The LWGate is a CGI script, written in Perl, which tries to merge the technologies of the WWW and mailing lists by: Presenting information about mailing lists to WWW users, Assisting users in executing mailing list commands though a user-friendly forms based interface, and Automatically generating a hypertext interface, on-the-fly, to list archives available on the local server. With the LWGate, people browsing the WWW can read a description of a mailing list, subscribe to a list, easily search a list's message archives, browse the archives in a hypertext format, search for other mailing lists, and much more. The LWGate supports mailing lists provided by LISTSERV(TM), List Processor 6, Majordomo, and SmartList servers.

Resource Specifications

Version:	1.17
Platform(s):	Unix
Price:	Free
Date Added:	Jul 9th, 1999
