Mortgage Loan Calculator

Hits: 2,222

Description: Mortgage Loan Calculator, by DotNetos Solutions, is a powerful tool built with precision and self-contained into one file. This allows for the simple integration of this script into any website. All one has to do is insert the "include" statement into a PHP file.

The calculator is able to find any of the 5 variables involved in a mortgage loan: Monthly Payment, Loan Amount, Down Payment, Interest, & Term or Number of Payments.

This script can run in 3 modes and allows the webmaster to set the default mode: Simple (basic case of loan that doesn't involve any taxes or insurance), Advanced (same as Simple with added taxes and insurance) & Complete (same as above with the addition of any fees that may be involved).

The results of the calculations are split into 3 parts, with the webmaster's ability to define the default setting: Summary, Amortization & Distribution.

Our concept is to keep the design simple for both the webmaster and the visitors/users. More features to come!

Resource Specifications
